

We are living in transitional times, when technologies and ways of thinking that seemed to serve us well in the past often offer dangerous consequences these days. But true innovators know how to discern threats, in this case to health and the environment, and possible benefits. So it would be gratifying and encouraging to see evidence of such thinking in the decisions by the Standing Committee on Science and Research, as well as by related organizations, regarding the use , the development of nuclear energy. From my perspective, the risks far outweigh any benefits, especially since technology into renewable energy sources is developing rapidly enough to be a viable alternative.

Best wishes for creative thinking,

Jo Hayward-Haines
